INTEGRAL surveys - what has gone before, and what might come next.

Tony Bird*[1]

[1]University of Southampton – United Kingdom

Abstract

This talk will look at the INTEGRAL surveys created since the beginning of the mission, and highlight their value to the wider X-ray community and beyond. The talk will look at the challenges of building two decades of data collection with an evolving instrument into a robust and trustable set of data products for the persistent, variable and transient objects that inhabit the INTEGRAL sky. The talk will include a preview of the work to create HEXA - an attempt to make an all-sky survey incorporating both IBIS and Swift/BAT data covering more than 20 years.
